Mexico Denies Five GE Cotton Permits for Commercial Release

Report Categories:

Biotechnology - GE Plants and Animals Biotechnology and Other New Production Technologies Cotton and Products

Annuared Dr.

Approved By: David Wolf

Prepared By:

Adriana Otero

Report Highlights:

On March 20, 2013, the Government of Mexico (GOM) denied two additional genetically engineered (GE) cotton commercial release requests in the Mexican states of Tamaulipas and Nuevo Leon. With this latest round of rejections by the GOM, the total number of denials of GE cotton seed for commercial planting extends to five. In 2012, five requests were also made for commercial planting of GE corn, but those requests are still pending with the GOM.

General Information:

On March 20, 2013, the Secretariat of Agriculture, Livestock, Rural Development, Fisheries and Food (SAGARPA) published <u>updated resolutions</u> through the National Service of Health, Food Safety, and Food Quality (SENASICA) on the status of 2012 requests (October requests) for environmental release of genetically modified crops. SENASICA announced that they have denied two GE cotton commercial release requests. This brings the total number of GE cotton commercial releases blocked by the GOM to five. The five commercial planting requests rejected were for the Mexican states of Tamaulipas, Nuevo Leon, Chihuahua, Coahuila, Durango, Baja California and Sonora.

Based on Mexico's Biosafety Law, all transgenic seeds must go through three different testing phases: experimental, pilot, and commercial. It is in the best interests of biotechnology developers to complete experimental testing as soon as possible in order to begin the pilot testing and, afterwards, the commercial release. This latest announcement by SENASICA is note worthy because these same types of GE cotton were approved the previous year for pilot release on 190,800 hectares (ha) in the states of Tamaulipas, Sinaloa, Chihuahua, Coahuila, Durango, Baja California and Sonora and for commercial release in Chihuahua, Coahuila, Durango, Baja California and Sonora on a total area of 341,000 ha.

Expectations have been high for approval for commercial permits for GE corn requested in September 2012. At this point, SENASICA, according with the Mexican Biosafety Regulation, is already delayed by more than one month and no approvals for commercial planting of GE corn requested in 2012 have been announced yet. This delay has been used by some anti-GE activist groups and various media outlets to recycle some of the old familiar non-scientific based rhetoric that's been repeated regularly over the course of the last two decades.

The municipalities where permits have been denied for commercial release for GE cotton are shown in Table 1.

Table 1. Mexico: GE cotton requests for commercial release in 2012 applications.

Information from GOM since 1988 to date regarding the requests and permits for environmental release on experimental, pilot and commercial stages of biotech crops is available on the website of the Interministerial Commission for Bio-safety of Genetically Modified Organisms (CIBIOGEM).

FAS/MEXICO Comments:

Agricultural biotechnology in general and the use of GE corn in particular is a very sensitive issue in Mexico. The debate is now reaching other crops beside corn. SENASICA's recent GE cotton seed rejection, coming on the heels of previous GE cotton seed approvals, shows just how sensitive the biotechnology policy issue is in Mexico. For example, cotton has been planted in Mexico since 1995 and producers have shown a solid preference for GE seeds. However, SENASICA's recent rejection of permits for commercial release of cotton is concerning to many, including cotton producers who say they are not given the opportunity to take advantage of sound science technology. The recent controversy regarding soybeans and honey (see GAIN MX2041) is another example of the overall sensitivity surrounding the development of biotechnology in Mexico.
